

MORE THAN 120 SHIPPING DRUMS

ANOTHER MILESTONE PROJECT WAS SUCCESSFULLY COMPLETED

The Hildebrandt Group could successfully complete another milestone project with its steel drums. In total, more than 120 shipping drums of size Ø 4500 with a width of 6.5m and a load capacity of 70.0t were shipped. The production of the drums was carried out according to the highest design and quality standards.

The drums will be used to transport cables for a wind farm in Scotland. They are thus an important component in the process of expanding renewable energies and reducing global warming.

In order to keep the CO2 footprint as small as possible for this project as well, we did not use a long road transport and chose the sea route as a partial route for the transport. By choosing this transport route, we were able to save over 28,000 kg of CO2 emissions.

The Hildebrandt Group is therefore not only proud to have received the enormous trust from the customer for the execution of the order, it is also proud to have played its part in achieving the Paris climate targets.
